

Clinderma AI Chatbot

Quality Evaluation Report

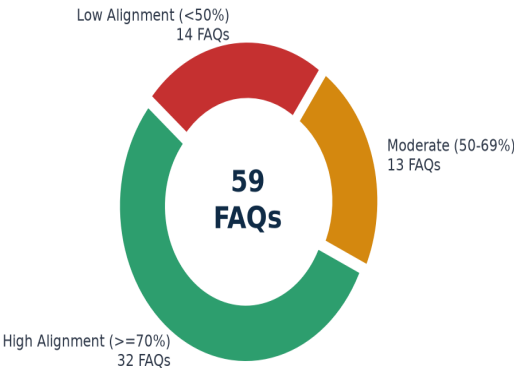

Comprehensive benchmark of the live Kandid AI WebSocket assistant against 55 ground-truth Master FAQs across 5 user cohorts. This report evaluates semantic alignment, keyword retention, clinical key-point coverage, and response latency to identify strengths and critical gaps.

Date	Endpoint	FAQs Evaluated	Evaluation Engine
August 2026	Kandid AI WebSocket	59 across 5 cohorts	Keyword + Key-Point Scoring

Key Performance Indicators

67.7% Overall Alignment	74.2% Keyword Coverage	63.3% Key Point Coverage	10.7s Avg Latency	32/59 High Alignment
-----------------------------------	----------------------------------	------------------------------------	-----------------------------	--------------------------------

Alignment Distribution

Score Distribution Summary

- 32 FAQs (54%)** scored **70% or above** — the chatbot produced clinically aligned, brand-consistent responses.
- 13 FAQs (22%)** scored **50–69%** — partially correct but missing specific clinical detail or brand language.
- 14 FAQs (24%)** scored **below 50%** — significant gaps where the bot gave generic or tangential answers, missing Clinderma's clinical philosophy.

Cohort Performance Analysis

Each user cohort was tested independently against its relevant subset of Master FAQs. The chart below shows performance across three scoring dimensions.

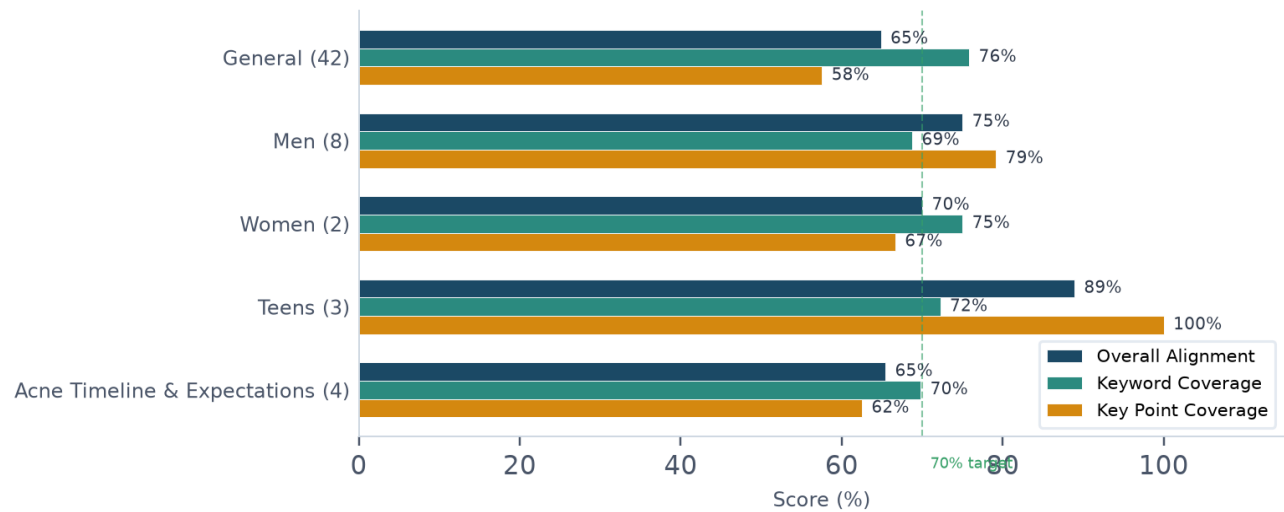

Fig 1. Cohort benchmark — dotted line marks the 70% alignment target.

Cohort	FAQs	Alignment	Keywords	Key Points	Latency	Assessment
General	42	64.9%	75.8%	57.5%	10.8s	Adequate
Men	8	75.0%	68.8%	79.2%	10.3s	Strong
Women	2	70.0%	75.0%	66.7%	8.9s	Adequate
Teens	3	88.9%	72.2%	100.0%	9.0s	Strong
Acne Timeline & Expectations	4	65.4%	69.8%	62.5%	11.8s	Adequate

Category-Level Breakdown

Categories are sorted from lowest to highest alignment score. Red bars indicate categories requiring prompt-engineering attention.

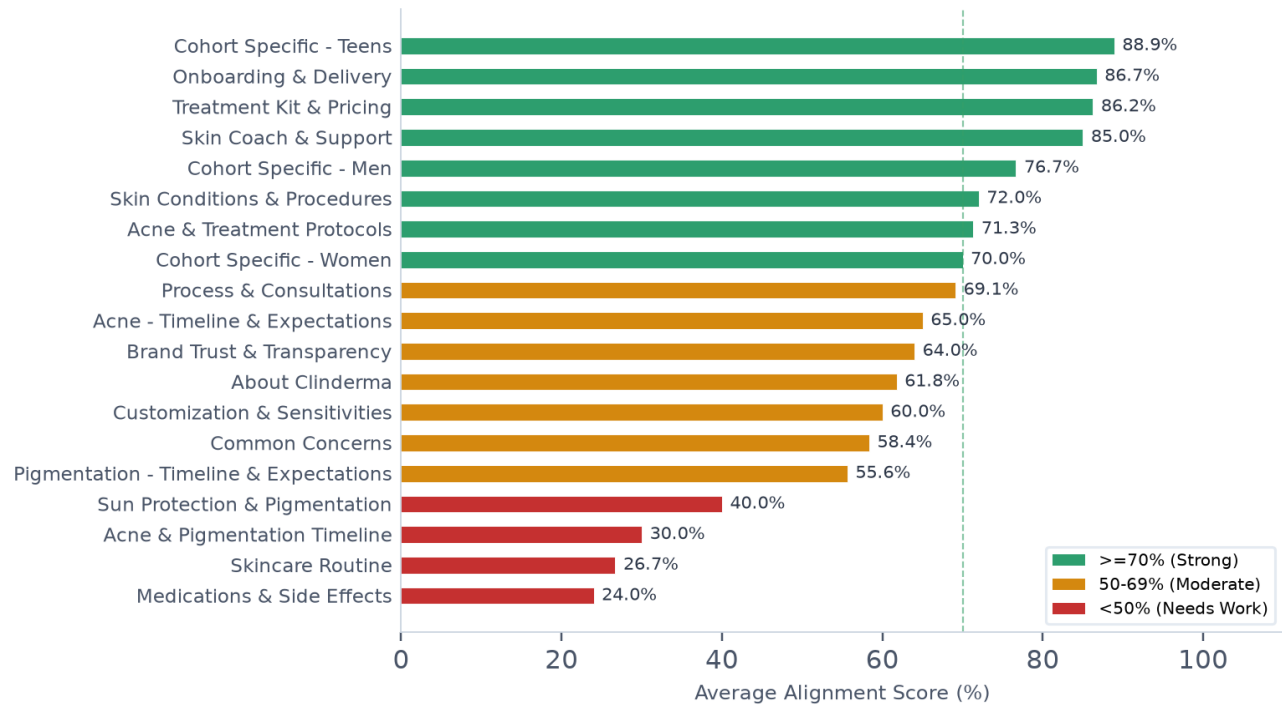

Fig 2. Per-category average alignment — sorted ascending to highlight gaps first.

Detailed FAQ-by-FAQ Results

Complete evaluation of all 59 tested FAQs. Each row shows the question, its alignment score, keyword match, key-point match, and any missing clinical points.

Strategic Recommendations

1. Strengthen Safety & Medication Prompting

For questions about treatment safety and oral medications, the chatbot defaults to generic 'consult a doctor' responses. The system prompt should explicitly ground the bot: *'All treatments are customized with FDA-approved actives, supervised by board-certified dermatologists, with dosage adjusted to individual sensitivity and continuously monitored.'*

2. Add Cohort-Specific Reassurance to System Prompt

Men: Explicitly confirm that topical actives (salicylic acid, azelaic acid, retinoids) have no adverse effect on beard density or testosterone levels.

Women: Reinforce pregnancy/breastfeeding safety with specific ingredient avoidance lists.

Teens: Continue current approach — teen cohort scores 88.9% and serves as a model.

3. Reinforce Root-Cause Messaging on Relapse Questions

When users ask 'Will acne come back?', ensure the bot states the core brand principle: *'Acne returns if root causes (gut health, hormones, stress, sleep) are ignored and only topical products are used. Clinderma addresses all these systematically.'*

4. Maintain Conversion CTA Embedding

Over 88% of responses successfully guide users to the Skin Assessment Test link. This is a strength to preserve.
